DETAILED ACTION

1. Claims 1-46 are allowed.
2. The following is an examiner's statement of reasons for allowance: the prior art of the record teaches scheduling for manufacturing process and products produces therein and control for production line that queues work-in-process (WIP) prior to a reentrant bottleneck processing; however, the prior art of the record fails to teach or fairly suggest in combination with the other elements and features of the claimed invention regarding claims 1-46, a control system, a method and a computer readable medium for managing a production schedule having time constraints that define a maximum elapsed time between operations, which comprising: a calculation unit and determination unit wherein the calculation unit define a plurality of sub-time constraints between each two operations of the production schedule and generate a plurality of equations representing functions of the time constraints and the sub-time constraints, and calculate a value for the sub-time constraints with the equations and the determination unit define a status for each operation according to a Work-In-Process (WIP) quantity between a first operation and a checked operation of the production line and check through throughput rate of the checked operation whether the status violates any of the sub-time constraints between the first operation and the checked operation, and release a lot into the production line if the status for each operation satisfies the corresponding sum of the sub-time constraints.
